

REMARKS/ARGUMENTS

In response to the Final Office Action mailed March 31, 2010 Applicants propose to amend their application and request reconsideration in view of the proposed amendments and the following remarks. In this amendment, claim 1 is proposed to be amended, no claims have been cancelled without prejudice and no claims have been added, so that claims 1-7 are currently pending. No new matter has been entered.

Claims 1 – 7 were rejected as being unpatentable over US Patent No. 6,443,972 to Bosma et al. (Bosma) in view of US Patent No. 6,364,895 to Greenhalgh (Greenhalgh). This rejection is respectfully traversed.

In order to make a finding of obviousness, an Examiner must (1) determine the scope and content of the prior art, including non-analogous art if it is in the field of endeavor reasonably related to the particular problem to which the claimed invention is directed, (2) ascertain the differences between the claimed invention and the prior art, considering both the prior art and claimed invention as a whole, and (3) resolve the level of ordinary skill in the art at the time of the invention, factoring in the creativity that one of ordinary skill in the art would employ as well as the Examiner's own knowledge and technical expertise.

It is respectfully submitted that the references taken as a whole fail to disclose or suggest all of the claimed limitations.

Bosma discloses a symmetrical vascular filter. Greenhalgh discloses an intraluminal filter for vascular use during medical procedures. It is delivered via a catheter and remains tethered thereto. Greenhalgh is made from a wire mesh and remains attached to a catheter. The present invention as claimed is a medical filter for therapeutic

treatment of a patient, comprising: a first and second end defining a longitudinal axis; a plurality of struts extending between the first and second ends, the struts tending to resiliently expand in radially outward directions from a compressed initial shape to an expanded deployed shape; wherein in the expanded deployed shape, the struts define a first and second filter section and a center section connecting the filter sections, the center section comprising longitudinally oriented struts; wherein each of the first and second filter sections define a number of filter cells, and the second filter section defines a greater number of filter cells than the first filter section; such that the second filter section exhibits a greater filtering efficiency than the first filter section, the medical device being configured for retrievable implantation within a vessel and including a hook structure for recapture positioned on at least one end. The combination of references fails to disclose or even suggest an asymmetrical filter formed from struts and having a hook for recapture. There is no reason to have combined the references without using the claimed invention as a template. Greenhalgh is an embolic protection device that remains attached to a delivery system and is formed from a mesh, while Bosma is a symmetrical vena cava filter. Never would the two be combined to develop an asymmetrical filter with a recapture hook. Accordingly, reconsideration and withdrawal of the rejection is respectfully requested.

Applicant would be grateful for the opportunity to conduct a telephonic or in-person interview if the Examiner believes it would be helpful in disposing of the present case.

A favorable action on the merits is earnestly solicited.

Respectfully submitted,

/Carl J. Evens/
